Layers and masks Photoshop layers enable you to create effects without altering the original photograph. Layers are transparent masks that can have layers (images) behind them. When you apply a filter, the filter goes over the top layer but not behind it; when you save your image, the layer is saved in its original state. Figure 4-6 shows a completed image

Q: Creating the most efficient form for a multidimensional array Here is my form: Could I make this code more compact by moving the input fields for title, location, etc. into a single row? Is it possible to put all the inputs under one another? A: Sure, you can create a single row. You could remove the labels and style it with a margin-top like so: [Bootstrap 3.x - Generate a Horizontal Form Example](#) This proposal describes a series of studies directed towards learning more about the pathogenesis of neuron death resulting from neurodegenerative diseases. Studies were begun that demonstrated the presence of a neurotoxin in the cerebral spinal fluid (CSF) of a patient with the multiple system atrophy (MSA) a slowly progressive, fatal neurodegenerative disorder. This neurotoxin was subsequently purified and shown to be a proteolytic enzyme belonging to a novel family. These studies demonstrated that the protease is present in the CSF of animals and humans with MSA. We also learned that there is a striking similarity between this enzyme and the calcium-activated neutral protease that is found in brain. In fact, the pH profile of the MSA enzyme is very similar to that of the brain enzyme. This similarity in enzymes suggests that it is possible that the protease in the MSA patients has a key role in the pathogenesis of this disease. This hypothesis will be tested directly by using methods previously designed to induce neuron death in brains of experimental animals. Finally, we will explore the possibility that damage of specific subpopulations of neurons is occurring in MSA and that specific proteases are important in this process.
